Managing the map

For Dr Darragh Lydon, QUB MediaLab, and Aashutosh. Prepared 26 October 2026 for handover by Monday 2 November 2026.

1. Open the administrator page

Open https://rastaaashu.github.io/ireland-games-map/admin.html after Aashutosh has completed setup and published this update. You can also open the map's About tab and choose Manage entries. The administrator page needs an internet connection. A message saying the live service is not configured means setup is still pending.

Use your own account. Aashutosh creates it and gives you its initial password privately. Keep the password in a password manager. Do not put it in a shared document or email it to a group. No commands are needed for everyday editing.

2. Log in and change your password

Enter your email address and password, then choose Log in. A successful login opens the entry list. Only approved administrators can use the editing controls.

To choose your own password or recover a forgotten one, enter your email address and choose Email me a password reset link. Open the latest reset email, follow its link and enter the new password twice. Use at least 14 characters. Log in again afterwards. Check spam if the email does not appear. Contact Aashutosh if a reset email does not arrive or the link has expired. Email delivery must be checked during setup.

The page logs you out after 15 minutes without activity or when the login expires, at most one hour. Unsaved work is discarded at that point. Refreshing or closing the page also ends the local session. Save before leaving, then use Log out on shared computers. Aashutosh can remove administrator access if an account is lost.

Adding and correcting entries

3. Find and correct an entry

Type its name, town or county in Find an entry. Choose Edit beside the correct entry. The list includes hidden entries and entries that cannot currently appear publicly.

Change the relevant fields. For example, to correct a town, check the organisation’s published address, correct the town and county, and update the public evidence link and date checked. Explain the correction in Why are you adding or changing this entry? Do not guess unknown details.

The website field is optional if a public evidence page is provided. The evidence page, source description, date checked, name, kind of entry and activity are required. Select the main activity from the dropdown. Select Unknown when lifecycle status is not evidenced. A broken website does not prove closure. Use Dissolved only with registry evidence.

Check the public-information confirmation and choose Save entry. Wait for the saved message. A saved change goes straight to the live store. Visitors loading or refreshing the live map use the current data. An already open map in another tab of your browser also reloads after a save. People using another browser need to refresh their map.

If someone else changed the entry while you were editing, the page refuses to overwrite their work. Cancel, refresh the entry list, reopen it, then apply your correction to the current version. If a connection fails during a save, refresh the list and check the history before saving again: the first save may already have reached the service.

4. Add an entry

Choose Add an entry. First search for an existing entry to avoid duplicates. Use the public display name and the kind of entry: Company, Organisation/course/group, or Individual practitioner. Choose the primary games activity. Supply a public evidence page and describe where the information comes from.

Enter only facts supported by the evidence. Unknown fields can remain blank. The date checked starts with today’s date; correct it if your evidence was checked on another day. A new entry starts without display permission. Check that permission only after completing the checks in section 7. Explain the evidence and permission basis in the reason field, without private contact details.

Check the public-information confirmation, then choose Save entry. The visibility message above Save tells you whether the entry will be public, hidden or excluded. A new entry with no coordinates still appears in the public map’s Index when its other publication conditions are met.

Locations and visibility

5. Set or correct a location

Open Set or correct the map position. Choose Find on map, then click the location on the map. Use the plus and minus buttons to zoom. You can instead type latitude and longitude, including by keyboard. The bundled overview has limited street detail; use public evidence to obtain a more precise position if needed.

A clicked point starts as an approximate town area. Change What does this position represent? only when evidence supports that precision. Address and postcode geocodes are still awaiting verification. A map click does not create a verified badge. Do not place a pin by guessing a private address. Choose Leave this entry without a map pin when the position is unknown.

6. Hide, restore and inspect history

Choose Hide beside an entry and give a short public-information reason. Hiding preserves the record and its history while removing it from new live map requests. It is suitable for a disputed or incorrect listing while it is checked. Closure is different: use the lifecycle status, since the map has a historic filter.

To bring a hidden entry back, choose Restore and explain why. Restoration removes the hidden flag. Display permission, sufficient relevance and primary-record status must still allow publication. Check the resulting label and the public map.

Choose Change history to see when an entry changed, the reason and the account ID responsible. Expand See before and after to inspect the saved values. History is created automatically and cannot be edited through the administrator page. Aashutosh can identify the account owner from the account ID. Earlier notes remain in the evidence trail.

Permission and privacy

7. Public information and permission

Every entry must have a traceable source: a source description, a public web page and the date it was checked. Prefer the organisation's own site, a registry, a university or a recognised sector directory. Do not use LinkedIn. Do not invent addresses, dates, categories, headcounts or source links.

Display permission means there is a checked basis for showing these details publicly. For an individual practitioner, obtain explicit permission for the public display name and information being shown. Public availability alone is not that person's permission. Keep the private permission correspondence in the project's approved private records, outside this administrator page. Record only a brief non-confidential basis in the reason. Follow the project's agreed public-source basis for organisations.

Never enter contact email addresses, private phone numbers, a person's home address, passwords, private correspondence or confidential notes. This applies to every field, including evidence notes, web links and change reasons. There is no private contact field in this system. The automatic email check is an extra safeguard, not a substitute for reviewing what you enter.

If permission is withdrawn, uncheck display permission, save the reason and hide the entry if appropriate. Tell Aashutosh promptly so the bundled offline copy and any exports can also be replaced. A saved live change cannot recall copies somebody already downloaded.

Help and project contacts

8. If the map is using an old copy

The public map contains a bundled snapshot so it can open during an outage. A snapshot warning shows its build date. This copy may still contain an entry that has since been hidden or corrected. The administrator page never saves into that old copy. When the live service returns, reloading the map fetches current entries.

For an urgent privacy correction, contact Aashutosh and request removal from the bundled copy and exports as well as the live store. Aashutosh manages those published files. Do not treat an offline snapshot as confirmation that a live save failed.

9. Who to contact

Aashutosh is the founder and technical maintainer responsible for accounts, source questions, privacy corrections, service configuration and publishing. Use the established project contact channel; this guide does not guess an email address. Dr Darragh Lydon is the QUB MediaLab collaborator receiving this handover. If access is unavailable, record the correction privately and send it to Aashutosh through the agreed channel. Never share your password to get help.
